

Implementing Web Application

Create IBM DB2 And Connect With Python

Step-1:

Pip install ibm_db

Step-2:

```
from ibm_db import connect
# Careful with the punctuation here - we have 3 arguments.
# The first is a big string with semicolons in it.
# (Strings separated by only whitespace, newlines included,
# are automatically joined together, in case you didn't know.)
# The last two are empty strings.
connection = connect('DATABASE=<database name>;'
                    'HOSTNAME=<database ip>;' # 127.0.0.1 or localhost works if it's local
                    'PORT=<database port>;'
                    'PROTOCOL=TCPIP;'
                    'UID=<database username>;'
                    'PWD=<username password>;', "", "")
```
